Task 4 Model Answer

Link: https://github.com/vagabond-systems/forage-lyft-task-4-model-answer

Since this task expects you to follow the TDD paradigm, changes exist to both source and test files. Start by looking at the top level classes and work your way inward. Note the changes required to implement tires in the system, and the subtle modification to the battery classes. Consider that the addition of tires follows the pattern set forth by engine and battery. Also note that the actual assignment of different tires to car models occurs in the car factory class. Think through how you would have implemented these changes in the original codebase. Would it have been easier or harder?
